Abstract

Background: Historically, several homoeopathic medicines are known to have attributed a significant role in the control and management of infectious epidemic diseases. **Objectives:** This study aimed to compile a list of prospective homoeopathic medicines for the treatment and prophylaxis of the COVID-19 epidemic by conducting a systematic review and statistical analysis of clinical characteristics of this emerging coronavirus disease. **Materials and Methods:** A systematic review protocol was developed according to the reporting items of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses statement. Articles for review were selected from PubMed, World Health Organization database, MedRxiv, and BioRxiv. Studies in English and simplified Chinese from December 2019 to March 26 2020 were included. Data on clinical characteristics, laboratory and CT chest results of COVID-19 were extracted and analysed. Several symptoms and their intensity were statistically analysed. **Results:** Seventy-three studies were included. Amongst COVID-19 patients, fever (119.869 ± 24.425 [95% confidence intervals: 71.149–168.589]), dry cough (91.028 ± 19.555 [52.007–130.050]) and dyspnoea (24.594 ± 5.949 [12.722–36.465]) were the most common symptoms. Leucopenia (16.06 ± 5.07 [5.95–26.18]) in blood, ground-glass opacity (62.23 ± 18.82 [24.74–99.72]), patchy (21.48 ± 12.36 [3.13–46.11]) and consolidation (18.67 ± 9.18 [0.373–36.968]) in the lungs were observed. The selected sign and symptoms were repertorised, which resulted in a list of multiple homoeopathic medicines as potential medicines for COVID-19, led by *Arsenic Album* (94.59%) and *Bryonia alba* (91.89%). **Conclusion:** Considering the current clinical manifestations, this is a pioneer study related to finding a plausible list of homoeopathic medicines that might help the profession in the treatment as well as to select a prophylactic of COVID-19 disease.

Keywords: 'Coronavirus', 'COVID-19', '*Genus epidemicus*', 'Homoeopathy'

INTRODUCTION

Several viral pneumonia cases occurred in Wuhan, China in December 2019, caused by a novel coronavirus,^[1] which declared COVID-19 as a pandemic.^[2,3] Historically, several homoeopathic medicines attributed a significant role in the control and management of infectious epidemic diseases including scarlet fever (1799), asiatic cholera (1831), Spanish flu (1920), keratoconjunctivitis (1995) and Chikungunya (2007).^[4-14]

Enumerating an epidemic region as a 'single patient' may help to describe all the striking symptoms (including peculiar, uncommon, redline and single symptoms) which can lead to an effective *Genus epidemicus* medicine.^[15-18]

A group of experts from Ministry of AYUSH, the Indian ministry of alternative medicine, has recommended homoeopathic medicine *arsenic album* 30C for protection against coronavirus infection.^[19] We have collected the latest

studies about the clinical characteristics of COVID-19 and conducted this systematic review and statistical analysis in different populations to provide references for finding the most indicated medicines for COVID-19.

MATERIALS AND METHODS

Study design

This study followed a preliminary exploratory and descriptive design. The study was conducted to find contemporary clinical manifestations of COVID-19 and analyse them to sort homoeopathic specific medicines, denominated as the most indicated medicines list.

Search databases and search strategies

A systematic review was performed and is being reported according to the 'Preferred Reporting Items for Systematic Reviews and Meta-Analyses' (PRISMA) statement. We searched four databases PubMed, Global literature on coronavirus disease of World Health Organization database, MedRxiv, and BioRxiv, to identify studies reporting COVID-19. The following keywords existing in MeSH were used in the search: 'clinical findings' or 'clinical characteristics' or 'Signs' and 'Symptoms' and 'COVID-19'.

Inclusion and exclusion criteria

Articles that were published in English and Chinese from December 2019 to 26th March 2020, were considered for this study. Irrespective of any design, based on the title and abstract, the articles were listed as a primary inclusion criterion. This also included diagnosed patients with severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infection who were treated in intensive care unit; and the clinical features of the patients who died due to SARS-CoV-2 were also considered. The considered clinical features comprised of subjective symptoms and signs, laboratory findings, abnormal Computed Tomography (CT) imaging results, forensic reports and comorbidities.

Non-English or Chinese articles that were published more than once, and those that presented with insufficient data on clinical characteristics were not included in the systematic review.

Data extraction and quality assessment

All the articles were critically appraised using the Methodological index for non-randomized studies (MINORS).^[20] Microsoft Excel database was used to record all available information. Data extraction, when available, included demographic information, clinical characteristics, abnormal chest computer tomography (CT) results, laboratory findings, the illness onset of the symptoms, comorbidities and deaths of patients.

Data analysis

We performed data analysis using meta-packages in STATA/IC 15.1.(STATA/ IC 15.1, StataCorp LLC, College Satation, Texas, USA) We first unified all units of variables and then, expressed continuous variables as mean (standard deviation) ± standard error (SE). The pooled estimated prevalence with 95%

confidence intervals (95% CI) of clinical symptoms, laboratory findings and chest CT findings of COVID-19 patients were calculated using a random-effects model because high variability between studies was expected.

Selection of the most indicated medicines

To perform effectively and efficiently, a systematic approach was adopted which is as follows. The results from signs and symptoms, abnormal chest computer tomography (CT), laboratory findings and comorbidities of COVID-19 were used for constructing an epidemiological profile.

After observing the totality of clinical characteristics, both the common symptoms of the disease, as well as uncommon or peculiar symptoms found in most patients suffering from COVID-19, were converted into the repertory language. After analysing the chest CT findings, considering their pathophysiology, and its patterns of clinical manifestations, they were included into repertorisation. In this regard, we used the Complete Repertory Database from Homopath Zomeo Repertory Software version 13.7.2®.(Homopath Zomeo Repertory Software version 13.7.2®, Mind Technologies Pvt Ltd 8, Mumbai, India)^[21] We also validated the equity of the data using Radar 10®^[22] software that is counted in the supplementary material [Supplementary Tables 1-4].

The selection of the homoeopathic medicines for COVID-19 was done by the standard method of determining the *Genus epidemicus* and a statistical approach. To complete and fulfil the totality of symptoms, according to homoeopathic philosophy, few common mental symptoms were added in the repertorisation. The number of symptoms and their intensity covered for every homoeopathic medicine was statistically analysed. Means ± SE and 95% CI were calculated to describe the distributions of categorical and continuous variables, respectively. The baseline data were analysed using the Stata version 15.1 software (STATA/ IC 15.1, StataCorp LLC, College Satation, Texas, USA).

RESULTS

Research selection and quality assessment

A total of 266 articles were selected for the study; after deleting duplicates, a sum of 241 records was retained, of which 51 were excluded based on the title or abstract. Then, 92 were eliminated due to lack of information on clinical characteristics. Finally, 25 were eliminated after reading the full text, and a total of 73 articles were included in this study^[23-96] [Figure 1].

Demographic characteristics and comorbidities

The study of clinical data included 73 studies with 11,139 patients. Table 1 summarizes the demographic characteristics and comorbidities of included studies. The mean age of the patients with SARS-CoV-2 infection was 44.72 (95% CI: 40.92–48.52); the mean of male patients was 75.45 and 66.35 female. The results of the comorbidities examination showed that hypertension (23.97±, 95% CI: 13.86–34.07), diabetes (11.81±, 95% CI: 6.88–16.75), and cardiovascular

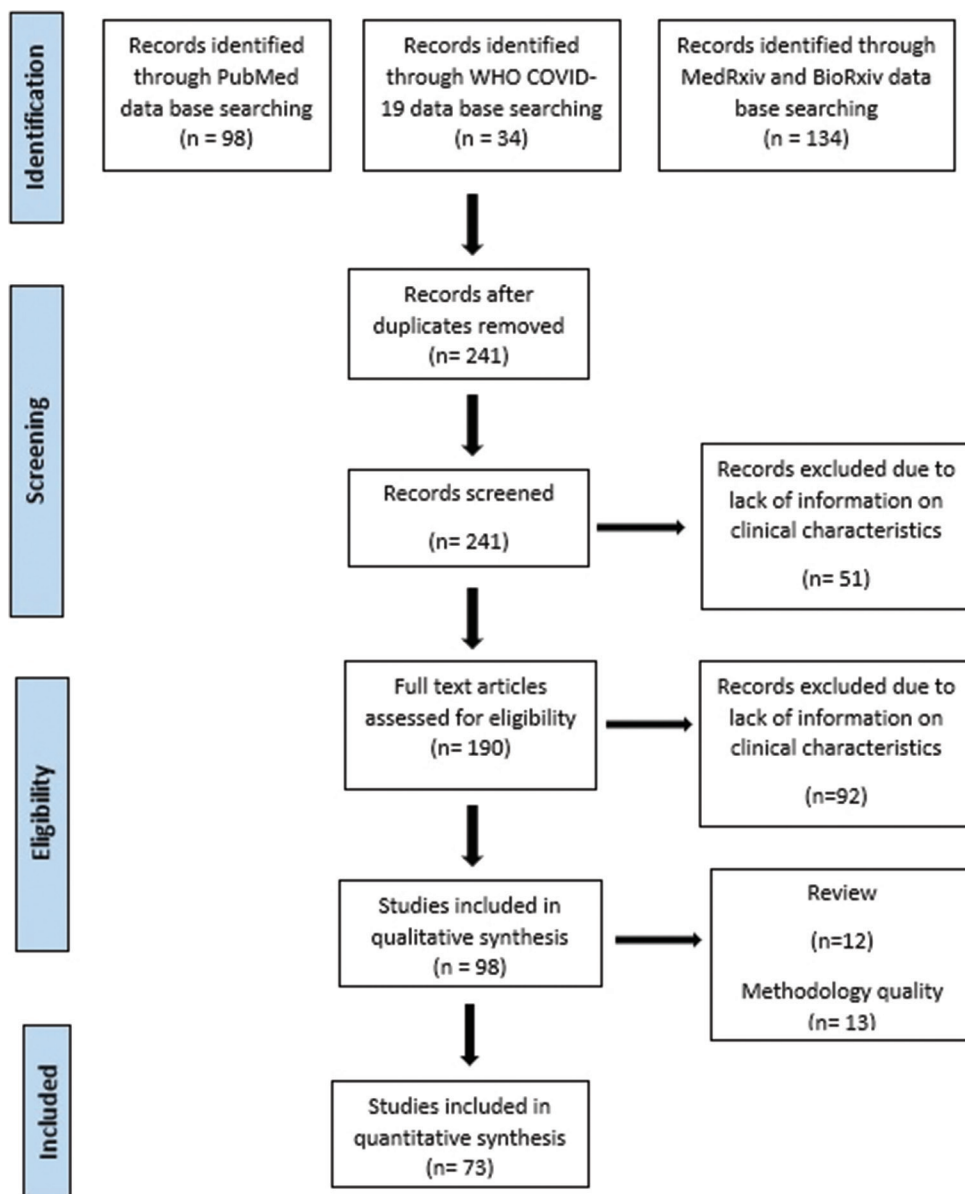

Figure 1: Flow diagram of the number of studies screened and included in the study

Variable	n	Mean ± SE	95% CI
Age	10,391	44.72 ± 1.90	40.92–48.52
Male	5491	75.45 ± 15.85	43.85–107.05
Female	4988	66.35 ± 12.96	40.49–92.20
Deaths	615	16.62 ± 8.55	–8.419–33.66
Comorbidities			
Hypertension	1702	23.97 ± 5.06	13.86–34.07
Diabetes	839	11.81 ± 2.47	6.88–16.75
Cardiovascular disease	474	6.67 ± 1.31	4.04–9.30
Lung disease	236	3.32 ± 0.842	1.64–5.004
Liver disease	235	3.29 ± 1.26	0.782–5.80

Mean of age was represented as years; mean data of male, female, deaths, hypertension, diabetes, cardiovascular disease, lung disease and liver disease were represented as number of patients. N: Number of patients, SE: Standard error, CI: Confidence intervals

disease (6.67 ±, 95% CI: 4.04–9.30) were more common in these patients [Figure 2].

Clinical presentation

We found that the main clinical symptoms of COVID-19 patients were fever (119.86 ± 24.42, 95% CI: 71.14–168.58), chilliness (6.31 ± 3.00, 95% CI: 0.32–12.31), dry cough (91.02 ± 19.55, 95% CI: 52.00–130.05), fatigue (41.76 ± 11.02, 95% CI: 19.76–63.77), and dyspnoea (24.59 ± 5.94, 95% CI: 12.72 - 36.46); all symptoms and distribution are reported in Table 2 and Figure 3.

Laboratory findings

The laboratory findings of the patients showed decreased white blood cell count (16.06 ± 5.07, 95% CI: 5.95–26.18), decreased neutrophil count (5.54 ± 1.93, 95% CI: 1.69–

9.40), increased lymphocyte count (6.91 ± 3.25 , 95% CI: 0.56–1.51) and decreased haemoglobin levels (5.67 ± 3.14 , 95% CI: -0.59–11.94), and total data regarding laboratory

results of COVID-19 patients is reported in Table 3 and Figures 4 and 5.

Chest CT findings

In the chest CT findings, it was found that the pneumonia was bilateral (46.5 ± 11.60 , 95% CI: 23.37 -69.62), compromised in the right lung (1.13 ± 0.64 , 95% CI: -0.14–2.41), involving predominantly lower lobe and upper lobe and peripheral distribution; total data incidence of chest CT lesions distribution is shown in Table 4 and Figure 6.

Ground-glass opacity (62.23 ± 18.82 , 95% CI: 24.74–99.72), patchy lesions (21.48 ± 12.36 , 95% CI: -3.13–46.11) and consolidation (18.67 ± 9.18 , 95% CI: 0.37–36.96) were the most frequent chest CT findings; total data incidence of chest CT findings is shown in Table 5 and Figure 7.

The most indicated medicines of COVID-19

By summarising clinical symptoms, laboratory findings, chest CT scan and comorbidities, we constructed an epidemiological profile of COVID-19 according to our statistical analysis [Table 6].

The repertorisation is shown in Table 7. Other repertorisations are included in the supplementary material [Supplementary Tables 1-4]. Finally, a total of 37 symptoms were selected and evaluated for repertorisation according to the epidemiological profile of COVID-19. A total of 1684 medicines coincided with the symptoms repertorised.

According to the totality of symptoms and their intensity, we found that the *Arsenicum album* covered 94.59% of symptoms (35/37, did not cover: pain, body, all over and chest, inflammation, lungs, pneumonia and bronchopneumonia) with high intensity (3.108 ± 0.228 , 95% CI: 2.64–3.57) and total intensity of 115.

Table 2: Incidence of clinical manifestations of COVID-19

Variable	n	Mean ± SE	95% CI

Mean data were described as number of patients. N: Number of patients, SE: Standar error, CI: Confidence intervals

Bryonia alba covered 91.89% of symptoms (34/37, did not cover: appetite, defective, loss anorexia; heart and circulation, thrombosis and heart and circulation, embolism) with high intensity (3.108 ± 0.218 , 95% CI: 2.66–3.55) and total intensity of 115.

Phosphorus covered 91.89% of symptoms (34/37, did not cover: respiration, difficulty and pain, during: Chest, in; pain, body, all over; and chest, inflammation, lungs, pneumonia, apex, upper) with high intensity (3.108 ± 0.200 , 95% CI: 2.70–3.51) and total intensity of 109, total statistical analysis of symptoms and their intensity from the most indicated medicines list for COVID-19 are shown in Table 8 and Figure 8.

DISCUSSION

In this study, we analysed 73 studies that happened from December 2019 to March 2020, counted numerous laboratory findings and radiological images. Clinical data of 11,139 patients' clinical data was reviewed to get a complete out-print of COVID_19. A wide variety of clinical presentations was observed in COVID_19, ranging from asymptomatic to critical states. Adults with various comorbidities including hypertension, diabetes, chronic kidney diseases and cardiovascular disease were more vulnerable than children.^[32,96]

This study summarised general symptoms of COVID-19 which included fever, chilliness, headache, dry cough, sore throat, chest pain, dyspnoea, anorexia and malaise. Furthermore, nausea, vomiting, and diarrhoea were obvious in some patients. In the recent past, researchers reported diarrhoea in Middle East respiratory syndrome-CoV and SARS-CoV in 30% and 10.6% of patients, respectively. Some other researchers indicated that SARS-CoV-2 has an increased affinity to angiotensin-converting enzyme 2 in the intestine which indicates gastrointestinal symptoms also should be considered in diagnosing COVID-19.^[97,98]

Haematological reports showed leucocytopenia, neutropenia, decreased haemoglobin, thrombocytopenia and elevated D-dimer. These findings suggest that COVID-19 may interfere with haematopoiesis. The inflammatory response initiated by SARS-CoV-2 may facilitate disseminated intravascular coagulation which reflects the severity of COVID-19.^[99-101]

Our study upholds that ground-glass opacity, patchy lesions and consolidations are the distinctive radiological marks in COVID-19 patients, which is consistent with previous studies.^[102-104] We also observed both the upper and lower lobes are involved along with the peripheral lung field; this indicates patients with COVID-19 symptoms should undergo computed tomography (CT) test as an alternative to real-time polymerase chain reaction to confirm.^[105]

Recently, several studies have demonstrated the successful application of the *Genus epidemicus* concept in the epidemics of chikungunya and dengue.^[7-10] Following the same theory, another successful study was conducted in rabbits.^[106,107] Considering the initial symptoms, the Ministry of AYUSH, India, suggested official guidelines for homoeopathic practitioners which are consistent with our findings.^[19,108] A

Figure 6: Box plot of the incidence of chest CT lesions distribution

case study of 18 symptomatic COVID-19 patients in Hong Kong reported the successful use of *Gelsemium sempervirens* in 12 patients, *Bryonia alba* in four patients, *Eupatorium perfoliatum* in one patient, and *Arsenicum album* in only one patient.^[109]

To the best of our knowledge, this current epidemiological study is a unique one to determine Hahnemann's *Genus epidemicus* of COVID-19 [Table 6], as this study considered and repertorised all clinical symptoms along with laboratory tests and radiological findings. The mental symptoms were

Figure 7: Box plot of the incidence of chest CT findings

not clear in COVID-19, till the time this study was conducted to fulfil the homeopathic approach. We found *Bryonia alba*, *Arsenicum album*, *Phosphorus*, *Sulphur*, *Pulsatilla nigra*, *Lycopodium clavatum*, *Aconitum napellus*, *Nux vomica*, *Belladonna*, *Calcarea carbonica*, etc., are prioritised in the list of the most indicated medicines for COVID-19. The selection of individualised homeopathic medicine is based on a patient's presenting clinical manifestations and individualised characteristics including mental symptoms.^[15] Moreover, the peculiar, rare and strange symptoms of all stages of COVID-19 and patients of different geographical regions should be

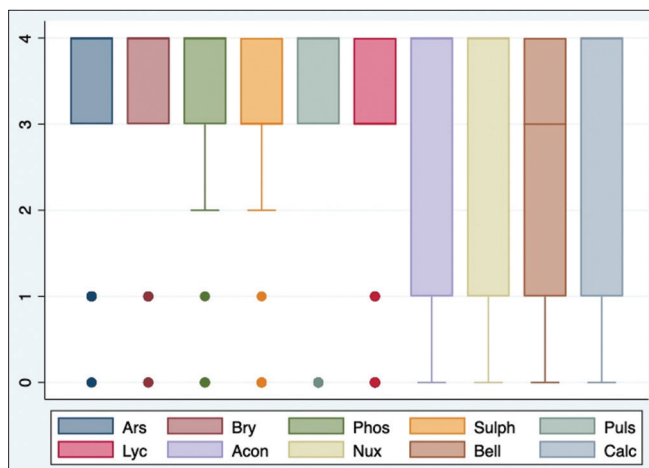

Figure 8: Box plot of the intensity of symptoms of the most indicated medicines list for COVID-19

Table 8: Genus epidemicus list

	n (%)	Mean ± SE	95% CI
Ars	35 (94.59)	3.108±0.228	2.64-3.57
Bry	34 (91.89)	3.108±0.218	2.66-3.55
Phos	34 (91.89)	3.108±0.200	2.70-3.51
Sulph	32 (86.48)	2.945±0.229	2.48-3.41
Puls	28 (75.67)	2.810±0.273	2.25-3.36
Lyc	30 (81.08)	2.756±0.252	2.24-3.26
Acon	31 (83.78)	2.729±0.264	2.19-3.26
Nux	30 (81.08)	2.729±0.264	2.19-3.26
Bell	29 (78.37)	2.702±0.268	2.15-3.24
Calc	29 (78.37)	2.648±0.277	2.08-3.21

Mean data were described as intensity of total of symptoms. 1: Low intensity, 2: Medium intensity, 3: High intensity, 4: Very high intensity, N: Number of patients, SE: Standar error, CI: Confidence intervals

considered.^[16] Unfortunately, these individualised features with mental symptoms were not documented in the COVID-19 studies included in the review. However, to satisfy our quest based on Homeopathy perspective of case description, we added ‘fear of disease’, ‘fear of death’ and ‘anxiety about health’ as common mental symptoms; [Table 6] and as expected, found a shuffle in the list of medicines [Figure 7].

We accept that there are limitations of this study including a lack of case studies and a control trial study to prove this theory. Furthermore, homeopathic system of natural medicine is still facing criticism due to deficient work in identifying the bioactive agent and its mode of action pathway.

CONCLUSION

A list of homeopathic medicines identified in the paper might be helpful in the treatment of COVID-19 patients. Case studies and randomised clinical trials based on this analysis are welcome for further confirmation. We also raise our hands in favour of using homeopathic medicines along with conventional medicines for a holistic approach.

कोविड-19 के लिए होम्योपैथिक दवाओं का एक समूह: नैदानिक विशेषताओं का एक सुव्यवस्थित पुनरावलोकन

पष्ठभूमि: ऐतिहासिक रूप से, होम्योपैथिक की विभिन्न दवाइयों को संक्रामक महामारी जनित बीमारियों की रोकथाम और प्रबंधन में एक महत्वपूर्ण भूमिका को आरोपित करने के लिए जाना जाता है। **उद्देश्य:** यह अध्ययन इस उभरती हुई कोरोनावायरस बीमारी की नैदानिक विशेषताओं के सुव्यवस्थित पुनरावलोकन एवं सांख्यिकीय मूल्यांकन को संचालित करने के माध्यम से कोविड-19 महामारी के उपचार और रोगनिरोध हेतु भावी होम्योपैथिक दवाओं की सूची को संकलित करने पर लक्षित है। **पद्धतियाँ:** एक सुव्यवस्थित पुनरावलोकन विज्ञप्ति को प्रिज्मा विवरण के प्रतिवेदित विषयों के अनुसार विकसित किया गया था। पबमेड, विश्व स्वास्थ्य संगठन के आंकड़ा कोष, मेडआरएक्सआईवी तथा बायोआरएक्सआईवी से लेखों को पुनरावलोकन के लिए चुना गया था। अंग्रेजी और सरल चीनी भाषा में दिसंबर 2019 से 26 मार्च 2020 के बीच किए गए अध्ययनों को समाहित किया गया था। नैदानिक विशेषताओं के आंकड़ें, कोविड-19 के प्रयोगशाला एवं छाती के सीटी निष्कर्षों को छँटा एवं विश्लेषित किया गया था। विभिन्न लक्षणों तथा उनकी तीव्रता को सांख्यिकीय तौर पर विश्लेषित किया गया था। **परिणाम:** 73 अध्ययनों को समाहित किया गया था। कोविड-19 मरीजों में, बुखार (119.869 ± 24.425 , [95% CI 71.149–168.589]), सूखी खाँसी (91.028 ± 19.555 , [52.007–130.050]), तथा श्वासकष्ट (24.594 ± 5.949 , [12.722 – 36.465]) सबसे सामान्य पाये जाने वाले लक्षण थे। रक्त में ल्यूकोपेनिया (16.06 ± 5.07 , [5.95–26.18]), ग्राउंड ग्लास ओपेसिटी (62.23 ± 18.82 , [24.74–99.72]), खंडमय (21.48 ± 12.36 , [3.13–46.11]), तथा फेफड़ों में जमावट (18.67 ± 9.18 , [0.373–36.968]) देखी गई थी। चुनिंदा चिन्हों एवं लक्षणों को प्रतिवेदित किया गया था, जिसके परिणामस्वरूप कोविड-19 के लिए संभावित दवाओं के तौर पर विविध होम्योपैथिक दवाओं की सूची सामने आई थी, जिनमें आर्सेनिक एल्बम (94.59 प्रतिशत) और ब्रायोनिया एल्बा (91.89 प्रतिशत) मुख्य दवाएँ थीं। **निष्कर्ष:** मौजूदा नैदानिक अभिव्यक्तियों के मद्देनजर, होम्योपैथिक दवाओं की एक विश्वसनीय सूची को ढूँढने के लिए किया गया यह एक ऐसा अग्रणी अध्ययन है जो इस पेश को कोविड-19 बीमारी के एक रोगनिरोध को चुनने के साथ-साथ उसका उपचार करने में मददगार साबित हो सकता है।

Un groupe de médicaments homéopathiques pour COVID-19 : une revue systématique des caractéristiques cliniques

Contexte: Historiquement, plusieurs médicaments homéopathiques sont connus pour avoir attribué un rôle important dans le contrôle et la gestion des maladies épidémiques infectieuses. **Objectifs:** Cette étude visait à compiler une liste de médicaments homéopathiques potentiels pour le traitement et la prophylaxie de l'épidémie de COVID-19 en effectuant une revue systématique et une analyse statistique des caractéristiques cliniques de cette maladie coronavirus émergente. **Méthodes:** Un protocole de revue systématique a été développé selon les éléments de rapport de la déclaration PRISMA. Les articles à examiner ont été sélectionnés dans PubMed, la base de données de l'Organisation mondiale de la santé, MedRxiv et BioRxiv. Des études en anglais et en chinois simplifié de décembre 2019 au 26 mars 2020 ont été incluses. Les données sur les caractéristiques cliniques, les résultats de laboratoire et de tomodensitométrie thoracique de COVID-19 ont été extraites et analysées. Plusieurs symptômes et leur intensité ont été analysés statistiquement. **Résultats:** Soixante-treize études ont été incluses. Parmi les patients COVID-19, la fièvre ($119,869 \pm 24,425$, [IC à 95% 71,149 – 168,589]), la toux sèche ($91,028 \pm 19,555$, [52,007 - 130,050]) et la dyspnée ($24,594 \pm 5,949$, [12,722 – 36,465]) étaient les symptômes les plus courants. Leucopénie ($16,06 \pm 5,07$, [5,95-26,18]) dans le sang, opacité de verre dépoli ($62,23 \pm 18,82$, [24,74-99,72]), irrégulier ($21,48 \pm 12,36$, [3,13-46,11]) et consolidation ($18,67 \pm 9,18$, [0,373-36,968]) dans les poumons ont été observés. Le signe et les symptômes sélectionnés ont été répertoriés, ce qui a abouti à une liste de plusieurs médicaments homéopathiques en tant que médicaments potentiels pour COVID-19, dirigée par Arsenic Album (94,59%) et Bryonia alba (91,89%). **Conclusion.** Compte tenu des manifestations cliniques actuelles, il s'agit d'une étude pionnière pour trouver une liste plausible de médicaments homéopathiques qui pourraient aider la profession dans le traitement ainsi que pour sélectionner une prophylaxie de la maladie COVID-19.

Un grupo de medicamentos homeopáticos para COVID-19: Una revisión sistemática de las características clínicas

Antecedentes: Históricamente, se sabe que varios medicamentos homeopáticos han atribuido un papel significativo en el control y manejo de enfermedades epidémicas infecciosas. **Objetivos:** El objetivo de este estudio fue elaborar una lista de posibles medicamentos homeopáticos para el tratamiento y la profilaxis de la epidemia de COVID-19 mediante una revisión sistemática y un análisis estadístico de las características clínicas de esta enfermedad coronavirus emergente. **Métodos:** Se desarrolló un protocolo de revisión sistemática de acuerdo con los elementos de informe de la sentencia PRISMA. Los artículos para revisión fueron seleccionados de PubMed, la base de datos de la Organización Mundial de la Salud, MedRxiv y BioRxiv. Se incluyeron estudios en inglés y chino simplificado de diciembre de 2019 a marzo de 26 2020. Se extrajeron y analizaron los datos sobre las características clínicas, los resultados de laboratorio y TAC torácicos de COVID-19. Se analizaron estadísticamente varios síntomas y su intensidad. **Resultados:** Se incluyeron setenta y tres estudios. Entre los pacientes de COVID-19, la fiebre (119.869 ± 24.425 , [IC del 95%: 71.149 a 168.589]), la tos seca (91.028 ± 19.555 , [52.007 - 130.050]) y la disnea (24.594 ± 5.949 , [12.722 - 36.465]) fueron los síntomas más comunes. Leucopenia (16.06 ± 5.07 , [5.95-26.18]) en sangre, opacidad del vidrio esmerilado (62.23 ± 18.82 , [24.74-99.72]), irregular (21.48 ± 12.36 , [3.13-46.11]), y se observó consolidación (18.67 ± 9.18 , [0.373-36.968]) en los pulmones. El signo y los síntomas seleccionados fueron repertorizados, lo que resultó en una lista de múltiples medicamentos homeopáticos como medicamentos potenciales para COVID-19, liderados por Arsenic Album (94,59%) y Bryonia alba (91,89%). **Conclusión.** Considerando las manifestaciones clínicas actuales, este es un estudio pionero para encontrar una lista plausible de medicamentos homeopáticos que podrían ayudar a la profesión en el tratamiento, así como para seleccionar un profiláctico de la enfermedad COVID-19.

Eine Gruppe homöopathischer Arzneimittel gegen COVID-19: Eine systematische Überprüfung der klinischen Merkmale

Hintergrund: In der Vergangenheit haben mehrere homöopathische Arzneimittel bekanntermaßen eine bedeutende Rolle bei der Kontrolle und Behandlung infektiöser epidemischer Erkrankungen gespielt. **Ziele:** Diese Studie zielte darauf ab, eine Liste prospektiver homöopathischer Arzneimittel zur Behandlung und Prophylaxe der COVID-19-Epidemie durch eine systematische Überprüfung und statistische Analyse der klinischen Merkmale dieser aufkommenden Coronavirus-Krankheit zu erstellen. **Methoden:** Ein systematisches Überprüfungsprotokoll wurde gemäß den Berichtspositionen der PRISMA-Erklärung entwickelt. Artikel zur Überprüfung wurden aus PubMed, World Health Organization Database, medRxiv und bioRxiv ausgewählt. Studien in Englisch und vereinfachtem Chinesisch von Dezember 2019 bis März 26 2020 wurden aufgenommen. Daten zu klinischen Merkmalen, Labor- und CT-Thoraxergebnissen von COVID-19 wurden extrahiert und analysiert. Mehrere Symptome und ihre Intensität wurden statistisch analysiert. **Ergebnisse:** Siebzig-drei Dreihundsechzig Studien wurden eingeschlossen. Unter COVID-19 Patienten, Fieber (119.869 ± 24.425 , [95% CI 71.149 - 168.589]), trockener Husten (91.028 ± 19.555 , [52.007 - 130.050]), und Atemnot (24.594 ± 5.949 , [12.722 - 36.465]) waren die häufigsten Symptome. Leukopenie (16.06 ± 5.07 , [5.95-26.18]) in Blut, Boden Glas Opazität (62.23 ± 18.82 , [24.74-99.72]), lückenhaft (21.48 ± 12.36 , [3.13-46.11]), und Konsolidierung (18.67 ± 9.18 , [0.373-36.968]) in der Lunge beobachtet wurden. Die ausgewählten Anzeichen und Symptome wurden repertorisiert, was zu einer Liste mehrerer homöopathischer Arzneimittel als potenzielle Arzneimittel gegen COVID-19 führte, angeführt von Arsenic Album (94.59%) und Bryonia alba (91.89%). **Schlussfolgerung:** In Anbetracht der aktuellen klinischen Manifestationen ist dies eine Pionierstudie, um eine plausible Liste homöopathischer Arzneimittel zu finden, die dem Beruf bei der Behandlung helfen und eine Prophylaxe der COVID-19-Krankheit auswählen können.

一组Covid-19的顺势疗法药物：临床特征的系统综述

背景: 历史上, 已知几种顺势疗法药物在传染病的控制和管理中发挥了重要作用。 **目的:** 本研究旨在通过对这种新兴冠状病毒疾病的临床特征进行系统审查和统计分析, 编制一份用于治疗 and 预防COVID-19流行病的前瞻性顺势疗法药物清单。 **方法:** 根据PRISMA声明的报告项目, 制定了系统审查方案。 供审查的文章选自PubMed, 世界卫生组织数据库, MedRxiv和BioRxiv。 包括2019年12月至2020年3月26日的英语和简体中文研究。 提取并分析了COVID-19的临床特征, 实验室和CT胸部结果的数据。 统计分析了儿种症状及其强度。 **结果:** 包括73项研究。 在COVID-19患者中, 发热 (119.869 ± 24.425 , [95%CI 71.149-168.589]), 干咳 (91.028 ± 19.555 , [52.007 - 130.050]), 和呼吸困 难 (24.594 ± 5.949 , [12.722 - 36.465]) 是最常见的症状 白细胞减少 (16.06 ± 5.07 , [5.95-26.18]) 在血液中, 地面玻璃不透明度 (62.23 ± 18.82 , [24.74-99.72]), 斑片 (21.48 ± 12.36 , [3.13-46.11]), 和整合 (18.67 ± 9.18 , [0.373-36.968]) 在肺中进行观察。 选择的标志和症状被重新分配, 这导致了多种顺势疗法药物作为COVID-19的潜在药物的列表, 由砷专辑 (94.59%) 和白蔷薇 (91.89%) 领导。 **结论.** 考虑到目前的临床表现, 这是一项先驱研究, 用于寻找可能有助于专业治疗的顺势疗法药物列表以及选择COVID-19疾病的预防性药物。
